Wilderness Applications/Lesson 5
Wilderness Protects Watersheds
(3 of 3 Wilderness and Water lessons)

**Goal:** Students will understand how Wilderness areas protect watersheds.

**Investigation Objectives:**
**Audience:** 9-12 Grades
- Students will understand which watershed they inhabit and how Wilderness areas protect the quantity and quality of water within a watershed. (Behavior)
- Students will be shown a series of maps in order to understand which watershed they inhabit and the general location of the location of Wilderness areas within watersheds. (Condition)
- Students will make observations about where they live within their watershed, the location of Wilderness areas within watersheds, and how Wilderness areas protect Watersheds. (Degree)

**Common Core Standard Connections**
NOTE: See Common Core Standards sections to see listed objectives for this and other lessons/activities.

**Time Requirement:** 50 minutes

**Materials/Resources Needed and Pre-Investigation Tasks**
- Map of Wilderness Preservation System
  - [www.wilderness.net](http://www.wilderness.net)
- Map of United States broken into regional watersheds
  - [http://water.usgs.gov/GIS/regions.html](http://water.usgs.gov/GIS/regions.html)
- Map of local watershed
  - Check with your local State or Federal water quality agency

**Teacher Background**
Teachers should be familiar with a map of the United States divided by watershed and the watershed in which they inhabit.
**Step-by-Step Presentation Instructions**

**Optional Pre-Investigation (Engage):** Give students a blank map of the United States and have them draw in (to the best of their knowledge) the main mountain ranges and rivers. This could be used as an engagement piece as well as a point of departure for the watershed discussion.

**Activity #1:** Students will look at a map of the United States divided by watershed and make observations and write down answers to the following questions on a spare sheet of paper:

![Select a Water Resources Region](http://water.usgs.gov/GIS/regions.html)

**Questions:**
1. How many watersheds does the United States appear to be divided into in this map?
2. Where are the main mountain ranges? And, how do mountain ranges shape watersheds? (Have students refer to a map showing major landforms of the U.S.)
3. To which ocean is water from (name a state) ultimately going?
4. Which watershed region do you currently live in? Have you lived or visited any other watersheds? If so, describe the difference between the climate and vegetation between the two different watersheds in which you have spent time.
Students will be shown a map of their state divided by watershed. Example:

- Ask:
  - Which watershed do you inhabit?
  - Can you name the main rivers within your watershed?
  - Can anyone draw a rough map of the main rivers within their watershed?
Students will then be shown a map of their watershed: (See example that follows):

Students will then compare and contrast the map of the United States divided by watershed with the map of the United States National Preservation System:

Source: www.wilderness.net

Assessment Activity: Written Reflection

Students will write responses to the following questions:
1.) Make observations on where the majority of Wilderness areas located on the map of the United States are?
2.) Select a watershed and list which (if any) Wilderness areas are located within your chosen watershed?
3.) Examine the watershed closer. Where in the watershed is the Wilderness area located? Is it near the origin, middle, or bottom?
4.) How does the Wilderness area help the quality and quantity of water within the watershed? Let’s consider:
   a. What activities are prevented from occurring within the Wilderness area that could pollute the water within the watershed?
   b. How could fish, wildlife, and plants benefit from Wilderness areas that are within watersheds?

**Journal Idea:** Students will be asked to journal and share recreational stories from within their watershed—these stories could be activities/events that have done in the past or activities/events that they would like to do in the future. Remind students to include details on the type of aquatic animals, plants, fish, etc. that they observed during their time in a specific part of the watershed.

**Resources for a More In-depth Topic Exploration:**
Teachers could organize a day of watershed restoration in which their students spend the day near a river or tributary that could benefit from trash removal. At the end of the day the class could take a photograph with all of the trash that they removed and make observations about how their actions benefited the quality of water within their watershed.
